# Backgrounds

Bitcoin & the Blockchain
"Satashi Nala"

"Satoshi Nakamoto" 2009

#### Cryptocurrency

- No central bank
- Transferring coins through trustless P2P network
- ~1200 USD per Bitcoin (coinbase.com 10/03/2017)

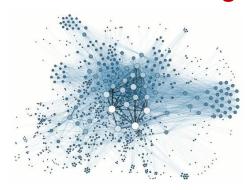

#### Technology

- Blockchain
- Distributed shared ledger
- Cryptograhy (SHA-256, PKI)
- Consensus model
- Smart contracts

## 4 Key Concepts of Blockchain

#### **Distributed shared ledger**

#### Consensus

#### Cryptography

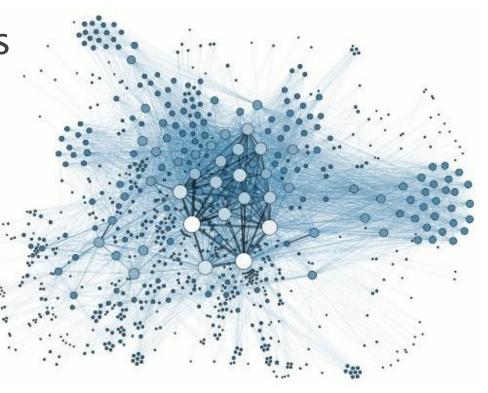

254F1 21B2C809 8833B0CC

7DED9 B57C 820 £E07
696DB 7D7F7 6DD29
0014D 41080C 7754E072
05552 534146DC 8 \$60929
18BFC 0F130429 90A60B99

#### **Smart contracts**

# 4 Key Concepts of Blockchain: Distributed Shared Ledger

- Group of replicated logs/databases (nodes)
- Transactions packed in blocks
- All nodes hold all transactions
- Parties identified with public key (= anonymised)
- Resilient for failure of one or more nodes

# 4 Key Concepts of Blockchain: 1.Distributed Shared Ledger

#### BITNODES

Bitnodes is currently being developed to estimate the size of the Bitcoin network by finding all the reachable nodes in the network.

GLOBAL BITCOIN NODES DISTRIBUTION Reachable nodes as of Sun Jun 14 2015 14:01:53 GMT+0200.

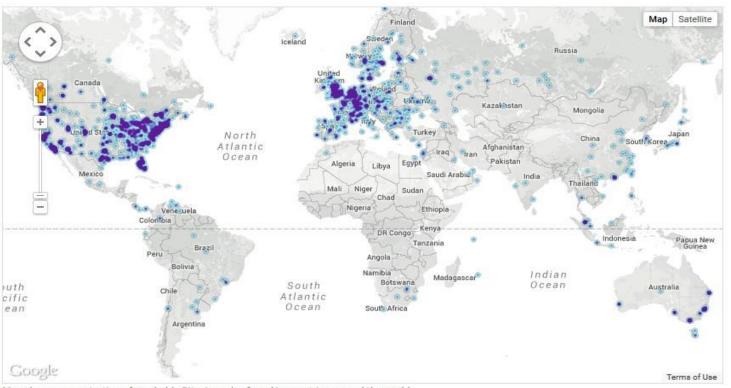

#### 5987 nodes

24-hour charts »

Top 10 countries with their respective number of reachable nodes are as follow.

| RANK | COUNTRY            | NODES<br>2161 (36.09%) |  |  |  |  |
|------|--------------------|------------------------|--|--|--|--|
| 1    | United States      |                        |  |  |  |  |
| 2    | Germany            | 626 (10.46%)           |  |  |  |  |
| 3    | France             | 442 (7.38%)            |  |  |  |  |
| 4    | United Kingdom     | 375 (6.26%)            |  |  |  |  |
| 5    | Netherlands        | 307 (5.13%)            |  |  |  |  |
| 6    | Canada             | 302 (5.04%)            |  |  |  |  |
| 7    | Russian Federation | 187 (3.12%)            |  |  |  |  |
| 8    | Australia          | 136 (2.27%)            |  |  |  |  |
| 9    | Sweden             | 116 (1.94%)            |  |  |  |  |
| 10   | China              | 102 (1.70%)            |  |  |  |  |

Map shows concentration of reachable Bitcoin nodes found in countries around the world.

#### JOIN THE NETWORK

Be part of the Bitcoin network by running a full Bitcoin node, e.g. Bitcoin Core.

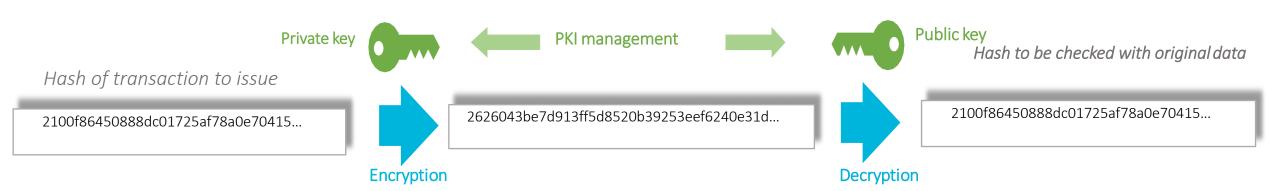

# 4 Key Concepts of Blockchain: 2.Cryptographic (1/2)

Tamper-proof log blocks using hash pointer

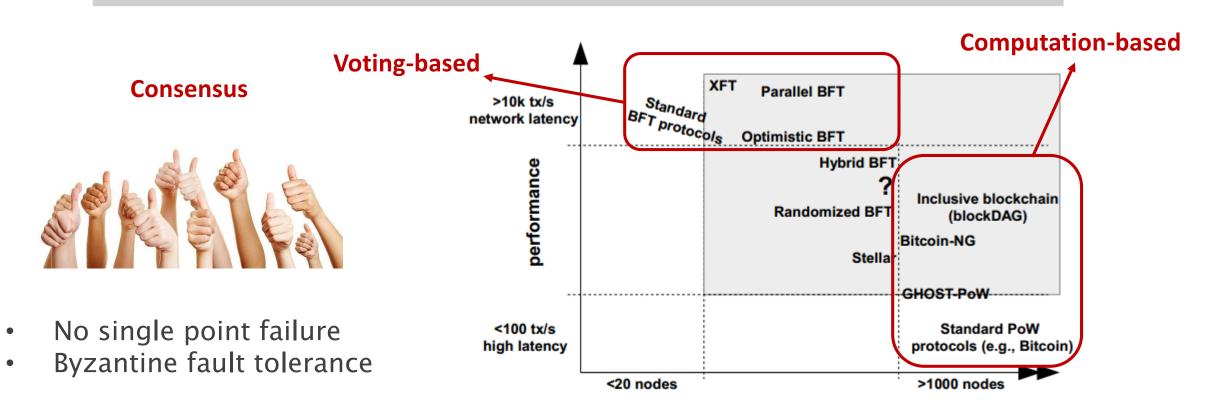

# 4 Key Concepts of Blockchain: 2.Cryptographic (2/2)

Asymmetric cryptography digital signature system

# 4 Key Concepts of Blockchain: 3.Consensus

#### node scalability

Cite: Vukolić, Marko. "The quest for scalable blockchain fabric: Proof-of-work vs. BFT replication."

# 4 Key Concepts of Blockchain: 4.Smart-Contract

#### **Smart contracts**

- Business logic that can be assigned to a transaction on the blockchain
- Acts as a 'notary' of blockchain transactions
- Holds conditions under which specific actions can/must be performed
- Facilitates escrow services
- Can't be modified without predefined permissions

```
*** An Ethereum smart contract to sell a website for "5000 by March"
    First, store buyer's ethereum address:
     6af26739b9ffef8aa2985252e5357fde in storage slot BUYER
note: Then, store seller's ethereum address:
     feab802c014588f08bfee2741086c375 in storage slot SELLER
    April 1, 2014 is 1396310400 in "computer time"
     1396310400 in storage slot DEADLINE
note: If the agreed amount is received on time..
when -
                    transaction value > >
                                                 5000 ether -
                    block timestamp
                                              storage slot DEADLINE
     note: ... then designate the buyer as the new website admin and pay the seller
                                      in storage slot WEBSITE_ADMIN
           storage slot BUYER
      spend contract balance to
                                      storage slot SELLER
```

## Category of blockchains

#### Public blockchain V.S. Private blockchain

 The majority of financial services firms exploring the use of blockchain are looking at private or semi-private blockchains, rather than the fully decentralized public blockchains

#### **Public blockchains**

- No authoritative permission required in order to participate
- Participants are not vetted
- Mechanisms for maintaining the network against attacks and unwanted parties therefore add cost and complexity to the network
- Usually use computation-based consensus protocols

#### **Private blockchains**

- Participants are known and identified.
- Legal contracts can help with system mechanisms.
- Usually use voting-based consensus protocols

## Problem Statement

Quest for understanding of private blockchain performance

 Design a general benchmark framework to find out to what extent can blockchain handle data processing workload.

## Problem Statement

Quest for understanding of private blockchain performance

 Design a general benchmark framework to find out to what extent can blockchain handle data processing workload.

#### Our framework will:

- Help blockchain application developers to assess blockchain's potentials in meeting the application needs.
- Help blockchain platform developers to identify and improve on the performance bottlenecks.

## Related Works

Three main challenges

Challenge 1: a blockchain system comprises many parts, we observe that a wide variety of design choices are made among different platforms at almost every single detail.

Approach: We extract the common modules of blockchain platform, and divide the blockchain architecture into three modular layers and focus our study on them: the consensus layer, the data model layer and smart-contract execution layer.

Three main challenges

Challenge 2: there are many different choices of platforms, but not all of them have reached a mature design, implementation and an established user base.

Approach: We start designing BlockBench based on three most mature platforms which support smart-contract funcionality, namely Hyperledger Fabric, Ethereum and Parity, and the framework is general to support future platforms.

Three main challenges

**Challenge 3:** There is lack of a database-oriented workloads for blockchain.

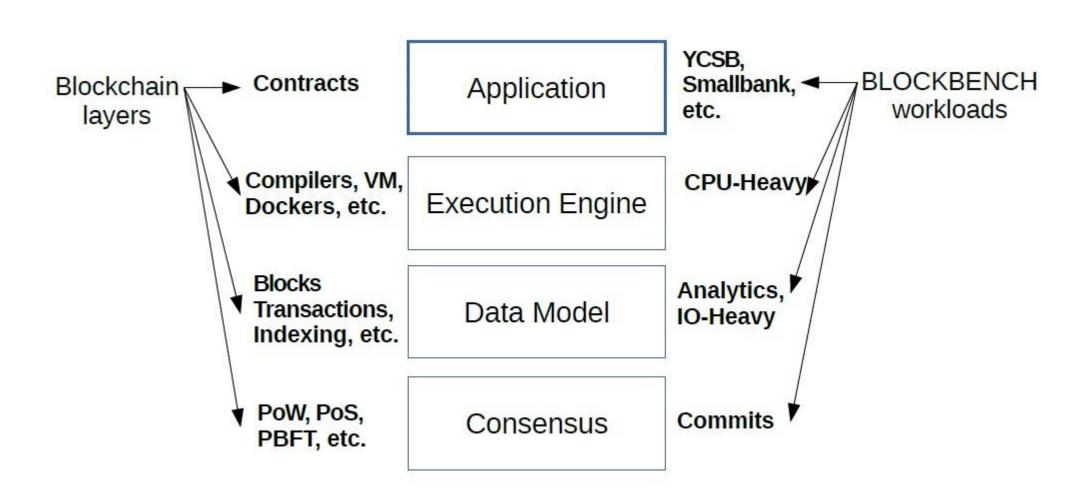

Approach: We treat blockchain as a key-value storage coupled with an engine which can realize both transactional and analytical functionality via smart contracts.

We design and run both transaction and analytics workloads in our benchmark framework.

## Workloads

|              |          |   | Smart contracts | Description                  |  |                      |   |
|--------------|----------|---|-----------------|------------------------------|--|----------------------|---|

#### BlockBench 的软件栈 将工作负载部署于 客户端 WorkloadClient 客户端 **IWorkloadConnector** 通过异步驱动, Configuration Driver StatsCollector 执行工作负载(workloads) 得到分析数据。 **IBlockchainConnector** Ethereum **ErisDB** Parity Hyperledger •••

将三个平台链接到后端

### 评测指标

01 交易吞吐量(tps)

02 交易延迟

03 可扩展性 增加节点数量、并发工作负载时,交易量和延迟的变化来衡量。

〇4 容错性 节点失效时,交易量和延迟的变化来衡量。

05 安全性指标 利用BGP 攻击,在一段时间内分割节点群。 然后导致区块链分叉(fork)。 主链上产生的块和用户确认块数之比,可以用来衡量安全性。 主链上产生的块越多,"双花"攻击、自私挖矿发生的概率就越低。

## Performance Benchmark

- We deployed Hyperledger, Ethereum and Parity
- The experiments run on 48–node commodity cluster.
  - Intel E5–1650 3.5GHz CPU
  - 32GB RAM
  - 2TB hard driver
- We collected comparison results in terms of our five metrics in macro benchmarks.
- We stress tested each individual layer using our micro benchmarks.

## Performance Benchmark

#### Main findings (1/2)

- Hyperledger performs consistently better than Ethereum and Parity across the benchmarks. But it fails to scale up to more than 16 nodes.
- Ethereum and Parity are more resilient to node failures, but they are vulnerable to security attacks that forks the blockchain.
- The main bottlenecks in Hyperledger and Ethereum are the consensus protocols, but for Parity the bottleneck is caused by transaction signing.

## Performance Benchmark

### Main findings (2/2)

- Ethereum and Parity incur large overhead in terms of memory and disk usage. Their execution engine is also less efficient than that of Hyperledger.
- Hyperledger's data model is low level, but its exibility enables customized optimization for analytical queries of the blockchain data.

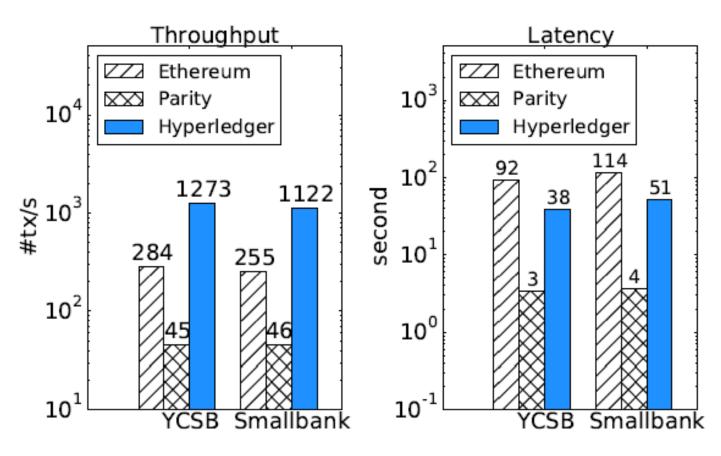

Figure: Throughput and latency of 3 systems over YCSB and SmallBank benchmark

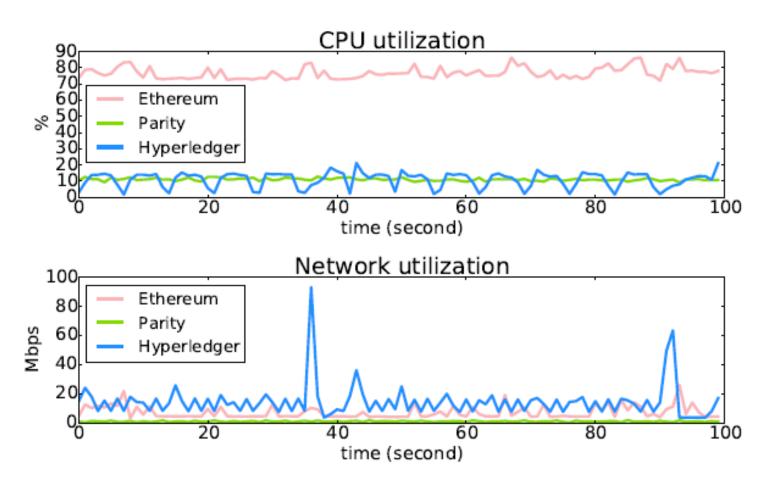

Figure: CPU & network resource utilization of 3 systems over YCSB benchmark

#### Observations (1/2)

- The gap between Hyperledger and Ethereum is because of the difference in consensus protocol. Hyperledger is communication bound (PBFT) whereas Ethereum is CPU bound (PoW).
- Parity processes transactions at a constant rate, and that it enforces a maximum client request rate at around 80 tx/s. Parity achieves both lower throughput and latency than other systems.

### Observations (2/2)

• In Ethereum and Hyperledger, there is a drop of 10% in throughput and 20% increase in latency from YCSB to Smallbank. This suggest that there are non-negligible costs in the execution layer of blockchains.

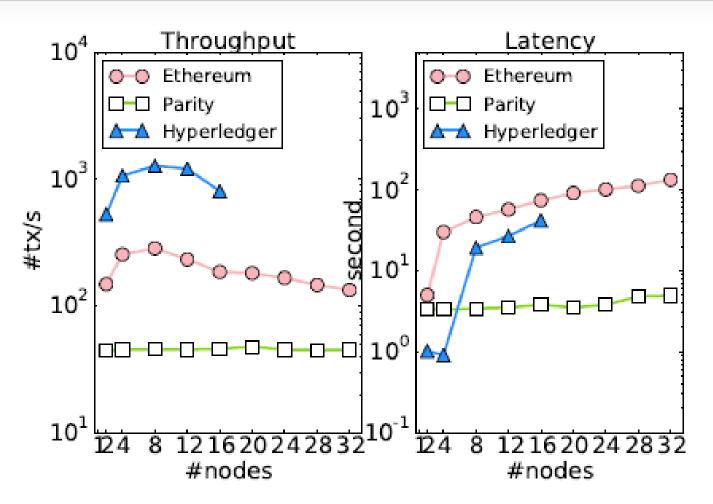

Figure: Performance scalability (with the same number of clients and servers).

# Scalability

#### Observations

- Parity's performance remains constant as the network size and oered load increase, due to the constant transaction processing rate at the servers.
- Ethereum's throughput and latency degrade almost linearly beyond 8 servers.
- Hyperledger stops working beyond 16 servers due to flaws in the implementation of the consensus protocol.

# Fault-tolerance & Security

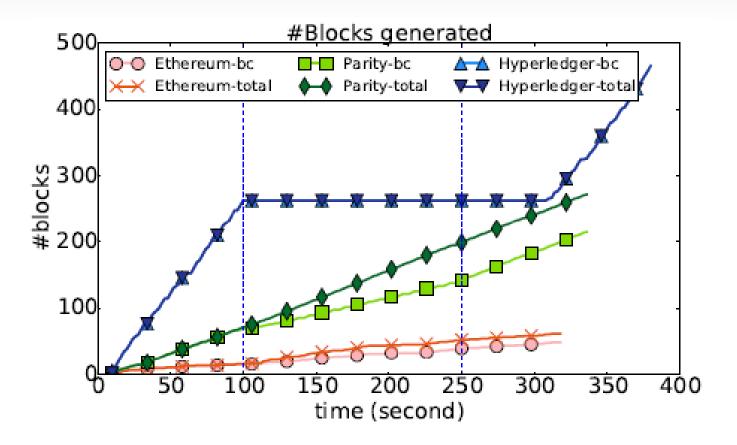

Figure: Blockchain forks caused by attacks that partitions the network in half at 100<sup>th</sup> second and lasts for 150<sup>th</sup> seconds. X-total means the total number of blocks generated in blockchain X, X-bc means the total number of blocks that reach consensus in blockchain X.

# Fault-tolerance & Security

#### Observations

- Hyperledger is more vulnerable to fail-stop fault.
- Ethereum and Parity fork under network partition, they are vulnerable to fork attacks.
- Hyperledger has safety property for consensus because of PBFT protocol.
- Hyperledger uses more time to recovery from network partition.

## Execution Layer - CPUHeavy

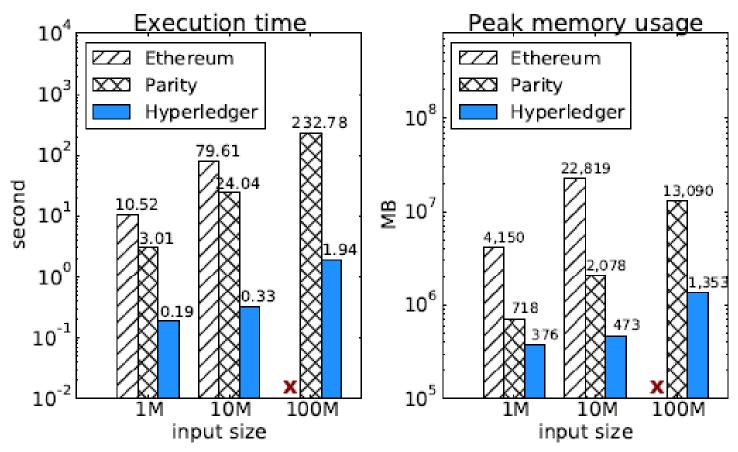

Figure: CPUHeavy workload, 'X' indicates Out-of-Memory error.

## Execution Layer - CPUHeavy

#### Observations

- Ethereum and Parity use the same execution model (i.e., EVM), but Parity has more optimized implementation.
- Hyperledger's execution engine is more computation and memory efficient than EVM.
- All three systems fail to make use of the multi-core architecture.

## Outline

- Introduction
  - Backgrounds
  - Problem Statement
  - Related Works
- BlockBench Framework
  - System Design
  - Implementation
- Performance Benchmark
  - Macro Benchmarks
  - Micro Benchmarks
- Discussion
- Conclusion

## Discussion

Bringing database designs into blockchain
Huge performance gap between blockchains and transactional
databases

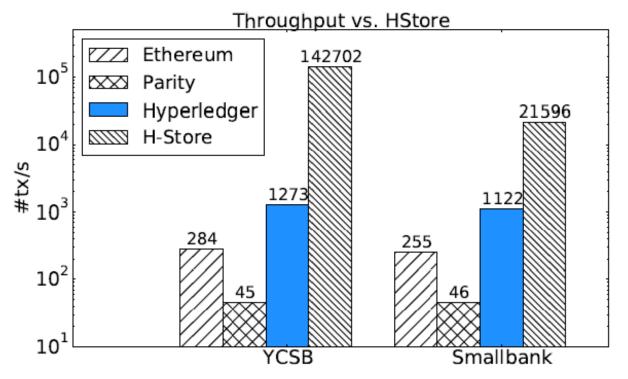

Figure: Performance of the three blockchain systems versus H-Store.

### Discussion

### Bringing database designs into blockchain

- Decouple storage, execution engine and consensus layer from each other, then optimize and scale them independently.
- \* Our system UStore demonstrates that a storage designed around the blockchain data structure is able to achieve better performance than existing implementations.

## Discussion

### Bringing database designs into blockchain

- Embrace new hardware primitives.
- \* For blockchain, using trusted hardware, the underlying Byzantine fault tolerance protocols can be modified to incur fewer network messages.
- \* Systems like Parity and Ethereum can take advantage of multi-core CPUs and large memory to improve contract execution and I/O performance.

## Conclusion

- BlockBench, to our knowledge, is the first comprehensive benchmark framework for private blockchain systems.
- We hope our results will serve as a baseline for further development of blockchain technologies.
